

Restore SQL Server Tables in Seconds

IT'S THAT FAST. Our new software restores tables from native SQL backups eliminating the need to restore the entire database – think of the time savings!

Extracting a table from a database backup without having to restore the entire database reduces restore time from hours to minutes.

Ontrack® PowerControls™ for Microsoft® SQL Server®

- Restore just the table you need – not the entire database
- Preview table content prior to restoration
- Drag and drop copied tables directly to the desired environment
- Spend minutes restoring versus hours or days
- Achieve an ROI well beyond the cost of the tool
- Support Snapshots or native SQL backups

Common Reasons for Restoration

Dropped tables can be weekly, sometimes daily occurrences, for example:

- A developer accidentally deleted a table.
- The Finance Department used the wrong currency or conversion rate on a report and needs to correct it.
- An administrator deleted rows causing the system to fail.

SQL Server Restore Process

Current SQL Server restore methods require the entire database be restored just to get to one table. SQL Server also must be present during the restore.

With Ontrack® PowerControls™ this process is simplified and shortened. From any workstation* simply find the backup or snapshot, query directly and restore!

Start saving time and money today with Ontrack PowerControls for SQL.
